AB A facile synthesis of a combinatorial ceramide library and their activities in the NF-κB pathway and in apoptosis induction/prevention were demonstrated. A novel NF-κB activating mol. was discovered among ceramide containing β-galactose, and the structural requirements of ceramides for apoptosis induction was elucidated.

AB Claimed photog. material having ≥1 Ag halide emulsion layer on one side of the support and a magnetic recording backing layer on the other side is characterized by the backing layer located furthest from the support contains a lubricator and a binder with the weight ratio of 1-1 + 104. Preferable lubricator is higher fatty acids and the derivs. with the coating weight of ≥1 mg/m2, and the preferable binder is hydroxyalkylcellulose. It improves the web-transporting characteristics, reduces dust sticking on the backing and increases readability of the magnetic signals. Thus, in a multilayer color neg. film having 3-fold backing layers, the outermost backing layer was comprised of hydroxyethylcellulose as the binder in which 7.5 mg/m2 of n-C15H31COOC40H81 (n) was incorporated. The completed material had the mentioned advantages.

AB In the preparation of the title amides and esters, steam is introduced into the reaction mixture containing a compound (having amino or OH group) and fatty acid RCO2H (R = C6-22 alkyl, alkenyl). The said amino- or OH-containing compound has b.p. greater than that of water. Steam was introduced into a mixture containing stearylamine and stearic acid. The said mixture is heated at 150° and 200 Torr for 5 h to give the amide product having a pleasant smell.

AB Dispersing agents for pigments used for inks, enamels, and transfer printing of polyester fibers, and dyes in organic solvents were prepared by condensing a diisocyanate, a polyol, and an amino or hydroxy amide or ester. Thus, a mixture of tolylene diisocyanate 30.4, benzoyl chloride 0.006, and a petroleum ether fraction (b. 55.deg.) 0.7 parts was condensed with 51.8 parts of a hydroxy ester (prepared from 12-hydroxystearic acid, hexadecanol and octadecanol, catalyzed by tetrabutyl titanate) and 0.2 parts Ac2CH2 and heated at 110.deg. for 1 hr. The mixture was cooled to 50.deg. and acetone 40, 1,6-hexanediol 15.3, and diazabicyclooctane 0.1 part was added, the mixture refluxed for 1 hr, 0.8 part MeOH added, and stirred for 2 hr at the boiling temperature Petroleum ether was added, the mixture distilled keeping the volume constant by adding petroleum ether until the temperature reached 101.deg., and diluted with petroleum ether so that the solution contained 49.4% dispersing agent (the ir spectra showed urethane groups). A mixture of β-form Cu phthalocyanine 3, the solution of dispersing agent 1.215, and petroleum ether 5.785 parts were milled for 16 hr to give a pigment composition useful for printing inks.

AB Me2NH was bubbled through 2361 g. oleic acid at 250° until an acid number of 5 was attained (8 h.). The resulting crude product was extracted with methanolic KOH to remove free acid and distilled in vacuo to give 2175 g. N,N-dimethyloleamide (I), iodine number 79.8, acid value 0.6. Stirred I (1100 g.) was treated with 1150 mL. 40% AcOOH containing 45 g. NaOAc during 1.5 h. at 30°, and the mixture washed and dried in vacuo to give 1153 g. product, iodine number 2.6, and 4.3% oxirane O, as determined by C5H5N-HCl titration Crystallization 3 times from Me2CO at -14° yielded 9,10-epoxy-N,N-dimethylstearamide (II), m. 34.1-4.8°. A mixture of 163 g. II, 100 mL. MeOH, and 72 g. Me2NH was autoclaved with stirring at 115-45° 4.5 h., cooled, and dried in vacuo to give 168 g. 9(10)-dimethylamino-10(9)- hydroxy-N,N-dimethylstearamide (III). II (163 g.), 100 mL. MeOH, and 87 g. morpholine autoclaved at 134-50° 10 h. gave 193 g. 9(10)-morpholino analog of III. The 9(10) amino analog of III was similarly prepared

IT 3852-19-5, Octadecanamide, 10-hydroxy-9-[(2-hydroxyethyl)amino]-N,N-dioctadecyl- 3852-20-8, Octadecanamide, 9-hydroxy-10-[(2-hydroxyethyl)amino]-N,N-dioctadecyl-
(preparation of)

AB Ilmenite flotation concentrates (from use of fuel oil-oleic acid mixts.) are treated with 0.05-0.2% amines (R'(R)NR'') to prevent excessive frothing during subsequent H_2SO_4 digestion. In the preferred amines, R and R' are alkyl groups containing 12-20 C atoms, and R'' is H or a saturated alkanoic acyl group containing up to 20 C atoms. Suitable treating agents are dioctadecylamine, dioctadecylstearamide, dihexadecylammonium stearate, dioctadecylammonium palmitate, dioctadecylstearamide sulfate, and ditetradecyl lauramide-HCl. Use of dioctadecylammonium myristate is also claimed.
